

# Slide 1: Context and Why Now — Insurance servicing must move from queues to conversations

## CHALLENGES AND IMPACT

- **Business problem:** Policyholders cannot self-serve routine motor claim queries — they must call and wait
- **Challenges:** Queue wait times, rigid IVR menus, repeated identity verification, inconsistent explanations
- **Impact:** High contact-centre cost, agent burnout, customer frustration, limited 24/7 availability

## STRATEGIC IMPERATIVE

- Customer expectations for instant, natural service are rising — IVR no longer acceptable
- Business drivers: cost reduction, agent capacity for complex cases, competitive differentiation
- Generative AI + automation now mature enough to handle verified, personalised claim queries safely

## SHIFT IN OPERATING MODEL — HOW AI CHANGES THE WORK

| Before (Today)                                     | After (Voice360)                                             |
|----------------------------------------------------|--------------------------------------------------------------|
| Customer calls, navigates IVR, waits for agent     | Customer chats with AI, gets instant verified answer         |
| Agent manually searches systems for claim status   | Verified action retrieves data automatically in seconds      |
| Context lost when transferred to another agent     | Structured handoff summary travels with the customer         |
| Agents handle all queries regardless of complexity | Agents focus on judgment, disputes, and vulnerable customers |

## Slide 2: Routine claim enquiries consume time and still deliver a fragmented experience

### EXISTING WORKFLOW

- 1. Customer calls insurer WAIT
- 2. Navigates IVR menu WAIT
- 3. Agent re-asks identity
- 4. Agent searches systems WAIT
- 5. Agent explains status
- 6. Repeat if transferred WAIT

### MANUAL ACTIVITIES

- Identity re-verification on every call
- Manual claim system lookup per query
- Verbal explanation of claim stages
- Manual callback scheduling

### PAIN POINTS AND INEFFICIENCIES

- Long handling times for low-complexity, repeatable queries
- No 24/7 availability — customers can only reach agents in business hours
- Inconsistent explanations across agents for the same claim stage

### TECHNOLOGY GAPS AND BUSINESS LIMITATIONS

| Gap                 | Business Limitation                                                                  |
|---------------------|--------------------------------------------------------------------------------------|
| Productivity issues | Agents spend 60–70% of call time on routine status queries instead of complex cases  |
| Technology gap      | IVR can route calls but cannot retrieve, verify, or explain individual claim data    |
| Context gap         | No structured handoff — agents repeat the same discovery questions at every transfer |
| Business limitation | Scaling service capacity requires hiring, not automation — unsustainable model       |

## Slide 3: Voice360 resolves routine needs and brings people in at the right moment

### WHAT THIS PROJECT ENABLES

- ▶ **✓ Improved efficiency** — routine queries handled instantly without agent involvement
- ▶ **✓ Faster decision-making** — verified claim data returned in seconds, not minutes
- ▶ **✓ Better customer experience** — natural language, empathetic, available 24/7
- ▶ **✓ Reduced effort and cost** — agents freed for complex cases requiring judgment

### STRATEGIC OUTCOMES

- ▶ **Business value:** Lower cost-per-contact for routine queries
- ▶ **Expected benefits:** Consistent claim explanations, shorter wait times, higher CSAT
- ▶ **Productivity gains:** Agents handle higher-value interactions; AI handles volume

### FUTURE STATE OPERATING MODEL — ROLE OF PEOPLE, PROCESS, AND AI

| AI (Voice360)                          | Process                                     | People                                |
|----------------------------------------|---------------------------------------------|---------------------------------------|
| Intent recognition and FAQ answers     | Verification gate before any data access    | Coverage and liability decisions      |
| Identity verification flow             | Claim ownership checked inside every action | Complaints and formal disputes        |
| Claim status retrieval and explanation | Confirmation required before write actions  | Vulnerability, fraud, bereavement     |
| Callback creation                      | Escalation triggered by policy rules        | Legal cases and complex negotiations  |
| Handoff summary generation             | Context packaged before every transfer      | Final judgment on all claim decisions |

# Slide 4: A grounded Copilot Studio agent built with GitHub Copilot throughout the lifecycle

## SOLUTION ARCHITECTURE

Customer (Chat / Voice)

Voice360 — Microsoft Copilot Studio

(Generative Orchestration · GPT-5 Chat)

- ├ Knowledge: 04-insurance-knowledge-base.md
  - | General process info only — no customer data
- ├ Power Automate Agent Flows
  - | VerifyCustomer → GetClaimStatus
  - | CreateCallbackRequest
  - | PrepareHandoffSummary
  - | └ Voice360DemoData.xlsx (Excel Online)
  - | Customers · Claims · Callbacks
- └ Human Agent / Callback escalation

GitHub Copilot used throughout:

- requirements · flow expressions · tests
- security review · documentation

## AI TOOLS USED

| Tool                     | Role                                                                                                                                                 |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| GitHub Copilot           | Requirements, Power Automate expressions, test case generation (28 cases), security review, all documentation, pre-commit hooks, agent configuration |
| Microsoft Copilot Studio | Agent platform — instructions, knowledge, topics, action hosting                                                                                     |

VerifyCustomer — Power Automate agent flow

[github.com/pulkit-xebia/voice360-capstone/blob/main/verifycustomer/requirements.md](https://github.com/pulkit-xebia/voice360-capstone/blob/main/verifycustomer/requirements.md) — GitHub Copilot best practices

Slide 5: End-to-end journey from question to resolution or contextual handoff

END-TO-END BUSINESS WORKFLOW AND USER INTERACTIONS

| User Action                          | AI Intervention                                     | Automation Opportunity                  |
|--------------------------------------|-----------------------------------------------------|-----------------------------------------|
| Customer asks about claim            | Intent recognised — FAQ or personal query           | No agent needed for general FAQ         |
| Customer provides policy, DOB, phone | VerifyCustomer action called — all 3 values matched | Automated identity verification         |
| Customer states claim number         | GetClaimStatus called with verified customer ID     | Automated data retrieval from Excel     |
| Customer reads status explanation    | AI explains in plain language — no jargon           | Consistent, approved wording every time |
| Customer requests callback           | Confirms reason, date, time — creates CB reference  | Automated callback record creation      |
| Customer asks for a person           | PrepareHandoffSummary → structured escalation       | Context auto-packaged for agent         |

DECISION-MAKING SUPPORT

- AI explains the current claim stage — never predicts outcome or makes a coverage decision
- Escalation is policy-driven: fraud, vulnerability, 2 failed verifications trigger automatic transfer
- Agent receives full context summary — no repeat questions required
